Space plasmas, examples and phenomenology

- Solar interior and atmosphere
- Solar corona and wind
- Heliosphere and energetic particles
- Earth’s magnetosphere
- Planetary magnetospheres
- The Earth’s bow shock
- Cometary plasmas

Corona of the active sun

1998

EIT - LASCO C1/C2
Electron density in the corona

+ Current sheet and streamer belt, closed
+ Polar coronal hole, open magnetically

Skylab coronagraph/Ulysses in-situ

Solar wind electron velocity distributions

Pilipp et al., JGR, 92, 1075, 1987

Core (96%), halo (4%) electrons, and "strahl"
Temperatures in the corona and fast solar wind

The elusive coronal magnetic field

Modelling by extrapolation

Schrijver et al.

- Closed loops and streamers
- Coronal funnels and holes
- Magnetic transition region (network)

Title et al.

Coronal field

Magnetic carpet
Loops, loops and more loops

Coronal magnetic field and density

Banaszkiewicz et al., 1998; Schwenn et al., 1997

Polar field: $B = 12$ G

Current sheet is a symmetric disc anchored at high latitudes!

LASCO C1/C2 images (SOHO)
Solar wind stream structure and heliospheric current sheet

Parker, 1963

Alfvén, 1977

Solar wind fast and slow streams

Helios 1976

Alfvén waves and small-scale structures

Marsch, 1991

$\Omega_p = 14.2^\circ$/day

$\tau_C = 27$ days
Alfvénic fluctuations (Ulysses)

Schematic power spectrum of fluctuations

(a) Alfvén waves
(b) Slow and fast magnetosonic
(c) Ion-cyclotron
(d) Whistler mode
(e) Ion acoustic, Langmuir waves

Elsässer variables:
\[ Z^\pm = V \pm V_A \]

Turbulence energy:
\[ e^\pm = 1/2 \left( Z^\pm \right)^2 \]

Cross helicity:
\[ \sigma_c = (e^+ - e^-)/(e^+ + e^-) \]
Energy spectra of heliospheric ion populations

- How are they accelerated?
- What is their composition?
- How do they propagate?
- What are the source spectra?

Energies: 1 keV - 100 MeV
Sources: Mainly shock acceleration at flares/CMEs and CIRs

Structure of the heliosphere

- Basic plasma motions in the restframe of the Sun
- Principal surfaces (wavy lines indicate disturbances)

Plasma structure of the Earth’s magnetosphere

The boundary separating the subsonic (after bow shock) solar wind from the cavity generated by the Earth’s magnetic field, the magnetosphere, is called the magnetopause. The solar wind compresses the field on the dayside and stretches it into the magnetotail (far beyond lunar orbit) on the nightside. The magnetotail is concentrated in the 10 R_E thick plasma sheet. The plasmasphere inside 4 R_E contains cool but dense plasma of ionospheric origin. The radiation belt lies on dipolar field lines between 2 to 6 R_E.
Flux tube (plasma) convection in the magnetosphere

The circulation of magnetic field lines (flux tube) caused by the solar wind is also experienced by the particles gyrating about them.

- Tailward plasma flow on open polar field lines and in the magnetospheric lobes.
- Earth-ward flow (drift) in the plasma sheet near the equatorial plane.

Dawn-dusk electric field:

\[ E = 0.2-0.5 \text{ mV/m} \]

Potential across polar cap:

\[ \Phi = 50-100 \text{ kV} \]

Electric equipotential contours in equatorial plane

The Earth rotates at a 24 h period. This gives \( \Omega_e = 7.27 \times 10^{-5} \text{ rad/s} \).

An inertial observer finds the corotation electric field:

\[ E_{cr} = - (\Omega_e \times r) \times B \]

This corotation electric field \( E_{cr} \) is directed radially inward and decreases with the square of the radial distance. The associated potential is about 100 kV.
Magnetospheric substorm

Substorm phases:
• Growth
• Onset and expansion
• Recovery

Conditions for merging:
• Southward solar wind magnetic field
• Perturbations in solar wind flow (streams, waves, CMEs)

Associated effects: Aurora (particle precipitation) and induced magnetospheric currents.

Boundaries between solar wind and obstacles
Planetary parameters and magnetic fields

Planetary magnetospheres

- Rotation, size, mass, ....
- Magnetic field (moment) of planet (object) and its inclination
- Inner/outer plasma sources (atmosphere, surface, moons, rings)
- Boundary layer of planet (object) and its conductivity
- Solar wind ram pressure (variable)

Dynamic equilibrium if ram pressure at magnetopause equals field pressure:

$$\rho_{sw} V_{sw}^2 = \frac{B^2}{2\mu_0} = \frac{B_p^2 (R_p/R_m)^6}{2\mu_0}$$

Stand-off distances: \(R_m/R_p = 1.6, 11, 50, 40\) for M, E, J, S.
Magnetospheric configurations

Schematic of the Earth's bow shock geometry
Electron and ion foreshock geometries

In the de Hoffman-Teller frame one moves parallel to the shock surface with a velocity $v_{HT}$, which transforms the upstream solar wind inflow velocity into a velocity that is entirely parallel to the upstream magnetic field. This velocity can be expressed by the shock normal unit vector, $\mathbf{n}$.

$$v_{sw} = v_{HT} + v_{sw\parallel}$$

$$v_{HT} = \mathbf{n} \times \left( v_{sw} \times \mathbf{B}_{sw} \right) / \mathbf{n} \cdot \mathbf{B}_{sw}$$

Electron and ion velocity distribution functions

The electron VDF changes from the typical core-halo shape into a broad heated one, which is due to acceleration in the potential of the shock ramp. The ion VDF change from the cold solar wind one by specular reflection and pitch-angle diffusion into a kidney-shaped beam and ring-type VDF in the foreshock region.
Turbulence and small-scale substructures at the quasiparallel Earth's bow shock

Electromagnetic waves in the vicinity of the bow shock
Electrostatic waves in the vicinity of the bow shock

Acceleration of auroral electrons

Mirror impedance due to a field-aligned electric potential drop

Acceleration of auroral electrons by a V-shaped electric potential
Key phenomena in space plasmas

- Dynamic magnetic fields
- Plasma confinement and flows (wind)
- Formation of magnetospheres
- Magnetohydrodynamic waves
- Shocks and turbulence
- Multitude of plasma waves
- Particle heating and acceleration

Complexity in space plasmas

- Highly structured nonuniform magnetic fields
- Multi-component plasmas from various sources
- Velocity distributions far from thermal equilibrium
- Multi-scale spatial and temporal processes
- Sharp but dynamic boundaries and interfaces
- Waves and turbulences everywhere
- Ubiquitous energetic particles
